Amendments to the Claims:

The listing of claims will replace all prior versions and listings of claims in the application:

5 **Listing of Claims:**

Claim 1 (currently amended): A computer system comprising:

an identification device comprising:

a memory for storing an identification code; and

a first wireless module for receiving a radio identification signal and then

10 emitting a radio user signal ~~with an~~ comprising the identification code;

wherein the first wireless module is also capable of generating a

corresponding electrical data signal while receiving a radio data signal,

and the memory is capable of storing the corresponding electrical data

signal; and

15 a host comprising:

a processing module for controlling operation of the host;

a second wireless module for emitting the radio identification signal and for
receiving the radio user signal;

a power supply for supplying power to the processing module while

20 receiving a power control signal; and

a control module electrically connected to the power supply;

wherein before the power supply supplies power to the processing module, the

control module is capable of checking whether the identification code within

the radio user signal matches a predetermined identification code as the

25 second wireless module receives the user signal; if the identification code

within the radio user signal matches the predetermined identification code,

the control module is capable of transmitting the power control signal to the

power supply.

30 Claims 2-4 (cancelled)

Appl. No. 10/708,903
Reply to Office action of October 18, 2007

5 Claim 5 (currently amended): The computer system of claim ~~[[3]]~~ 1 wherein the identification device further comprises an input port for receiving ~~[[an]]~~ the corresponding electrical data signal, and the memory is capable of storing the corresponding electrical data signal received by the input port.

10 Claim 6 (currently amended): The computer system of claim 5 wherein the input port is capable of being used to provide required power of the identification device or to charge ~~the a~~ a battery comprised by the identification device for supplying power to the identification device.

Claim 7 (currently amended): The computer system of claim 1 wherein the identification code is ~~the~~ an ID of the identification device or a password.

15 Claim 8 (original): The computer system of claim 1 wherein the host further comprises an input interface for receiving input data; wherein the predetermined identification code is capable of being modified through the use of the input interface, and the identification code stored in the identification device is capable of being modified in a wireless way via
20 the second wireless module of the host.

25 Claim 9 (currently amended): The computer system of claim 1 wherein the identification device regularly emits the radio user signal via the first wireless module with a predetermined period, and the host receives the radio user signal via the second wireless module based on the predetermined period to determine the location of the identification device.

30 Claim 10 (currently amended): The computer system of claim 9 wherein the radio user signal emitted from the identification device complies with a bluetooth communication protocol.

Appl. No. 10/708,903
Reply to Office action of October 18, 2007

Claim 11 (currently amended): The computer system of claim 9 wherein the radio user signal emitted from the identification device complies with an 802.11x communication protocol.

5

Claims 12-42 (cancelled)

Claim 43 (new): A computer system comprising:

an identification device comprising:

- 10 a memory for storing an identification code;
 a first wireless module for receiving a radio identification signal and then
 emitting a radio user signal comprising the identification code; and
 an input port for receiving an electrical data signal; and
a host comprising:
- 15 a processing module for controlling operation of the host;
 a second wireless module for emitting the radio identification signal and for
 receiving the radio user signal;
 a power supply for supplying power to the processing module while
 receiving a power control signal; and
- 20 a control module electrically connected to the power supply;
wherein the memory is capable of storing the electrical data signal received by
the input port and wherein before the power supply supplies power to the
processing module, the control module is capable of checking whether the
identification code comprised by the radio user signal matches a
- 25 predetermined identification code as the second wireless module receives
the radio user signal; if the identification code comprised by the radio user
signal matches the predetermined identification code, the control module is
capable of transmitting the power control signal to the power supply.

30 Claim 44 (new): The computer system of claim 43 wherein the identification device

Appl. No. 10/708,903
Reply to Office action of October 18, 2007

comprises a battery for supplying power to the identification device.

5 Claim 45 (new): The computer system of claim 44 wherein the input port is capable of being used to provide required power of the identification device or to charge the battery.

10 Claim 46 (new): The computer system of claim 43 wherein the first wireless module is also capable of generating the electrical data signal while receiving a radio data signal.

Claim 47 (new): The computer system of claim 43 wherein the identification code is an ID of the identification device or a password.

15 Claim 48 (new): The computer system of claim 43 wherein the host further comprises an input interface for receiving input data; wherein the predetermined identification code is capable of being modified through the use of the input interface, and the identification code stored in the identification device is capable of being modified in a wireless way via the second wireless module of the host.

20 Claim 49 (new): The computer system of claim 43 wherein the identification device regularly emits the radio user signal via the first wireless module with a predetermined period, and the host receives the radio user signal via the second wireless module based on the predetermined period to determine the location of the identification device.

25 Claim 50 (new): The computer system of claim 49 wherein the radio user signal emitted from the identification device complies with a bluetooth communication protocol.

30

Appl. No. 10/708,903
Reply to Office action of October 18, 2007

Claim 51 (new): The computer system of claim 49 wherein the radio user signal emitted from the identification device complies with an 802.11x communication protocol.
